Conference

Grapevine, Texas – March 21, 2016

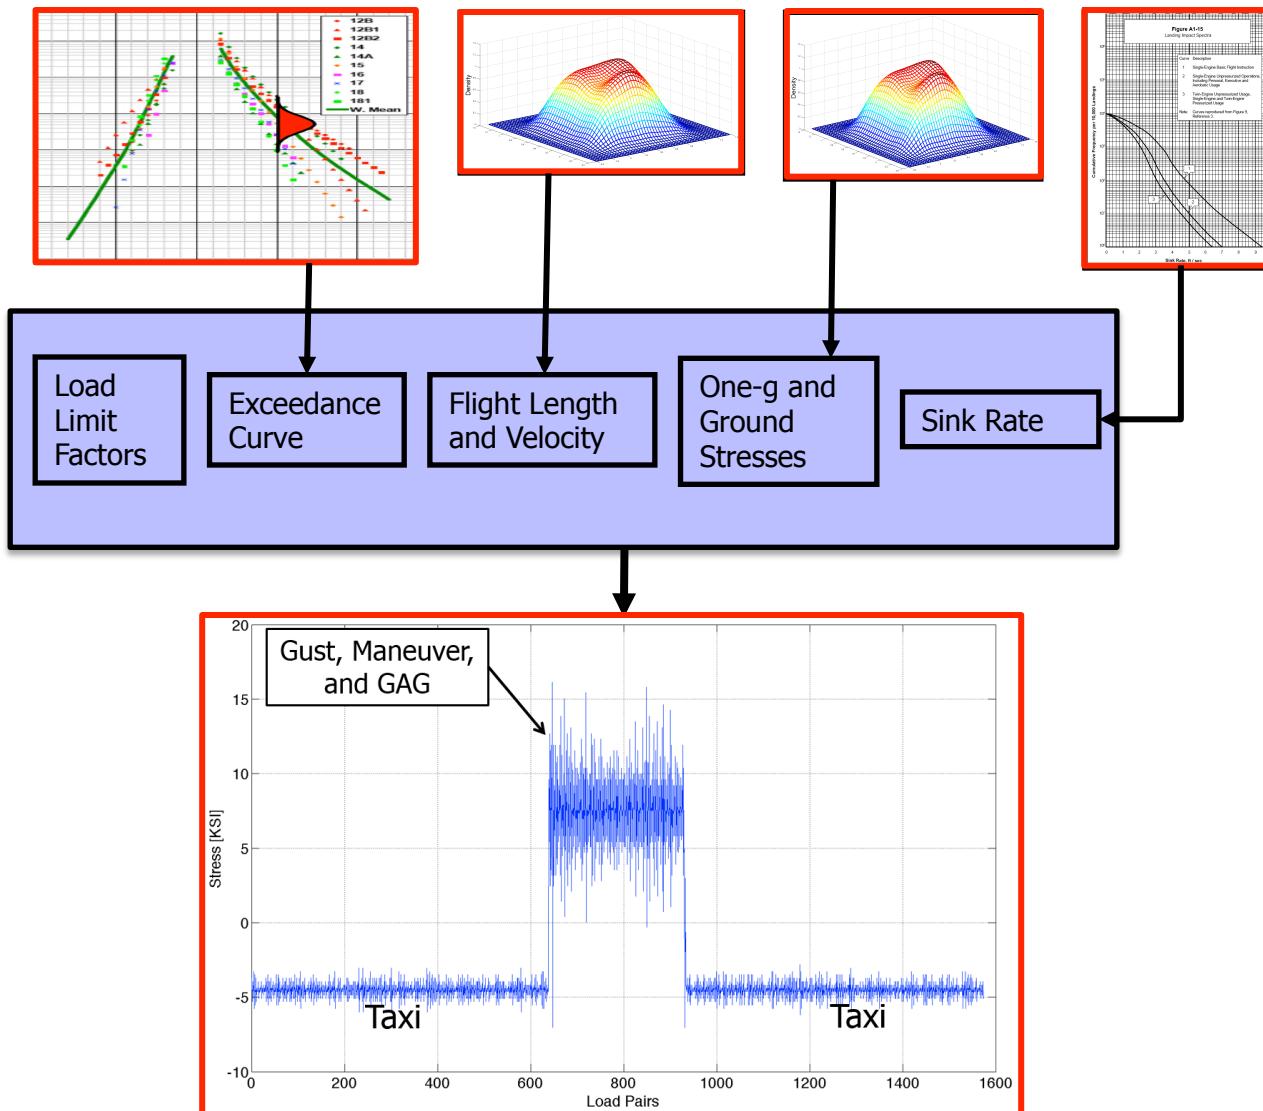

Spectrum Loading

SMART_{DT}

SMall Aircraft Risk Technology - Damage Tolerance Analysis

Spectrum Generation

- ✓ Exceedance curves
 - ✓ internal and user-defined
- ✓ Mixed usages
- ✓ Flight duration and weight matrices random to simulate flight profiles and different operations
- ✓ Randomized flights and stresses
- ✓ Spectrum editing options
- ✓ User-defined spectra
 - ✓ Afgrow format

Loading Exceedance Options

TEXTRON AVIATION

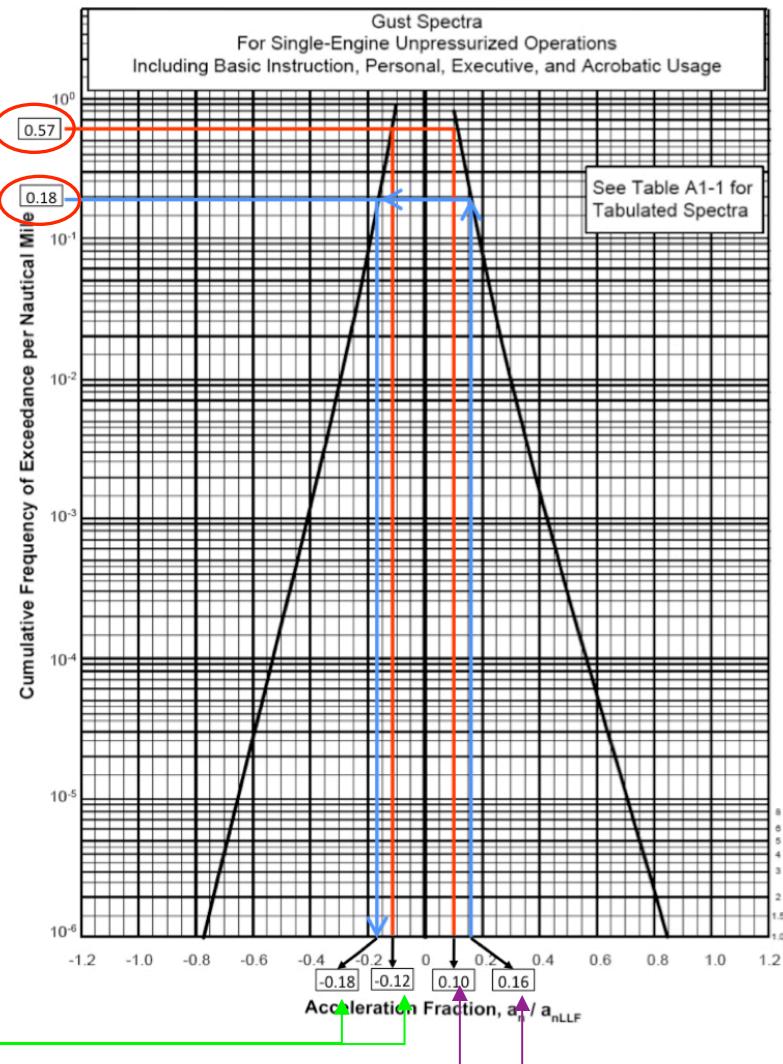

Load Spectrum Generation

From the Figure, make a sweep reading the a_n/a_{nLLF} (+), Positive values of gust load factor ratio.

From the Figure read the values of cumulative occurrence of gust per nautical mile at a specific gust load factor.

From the Figure read the a_n/a_{nLLF} (-), Negative values of gust load factor ratio at a positive gust load factor.

NuSS
Sustainment
Solutions

TEXTRON AVIATION

Load Spectrum Generation

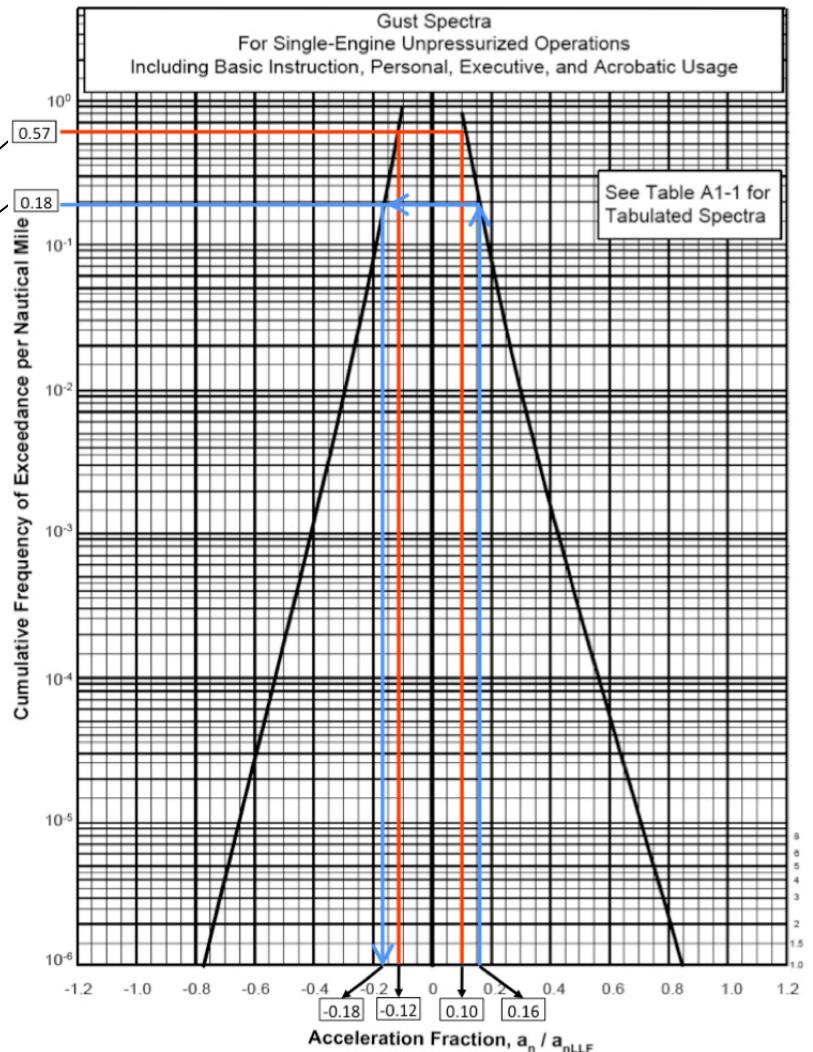

Frequency per nautical mile
(no accumulation) - difference
between two successive values
of cumulative occurrence of
gust

$$0.57 - 0.18 = 0.39$$

Input = Vel. at Cruise

Number of gust cycles
accumulated per hour,
(Frequency per nautical mile) x
(Design Cruise Speed (Vc)).

$$0.39 \times (165 \text{ Kts}) = 64.5 \text{ (n, Damage rule)}$$

NuSS
Sustainment
Solutions

TEXTRON AVIATION

Load Spectrum Generation

$$a_{nLLF} = \pm 2.155$$

Stress increment due to the gusts (a_n)

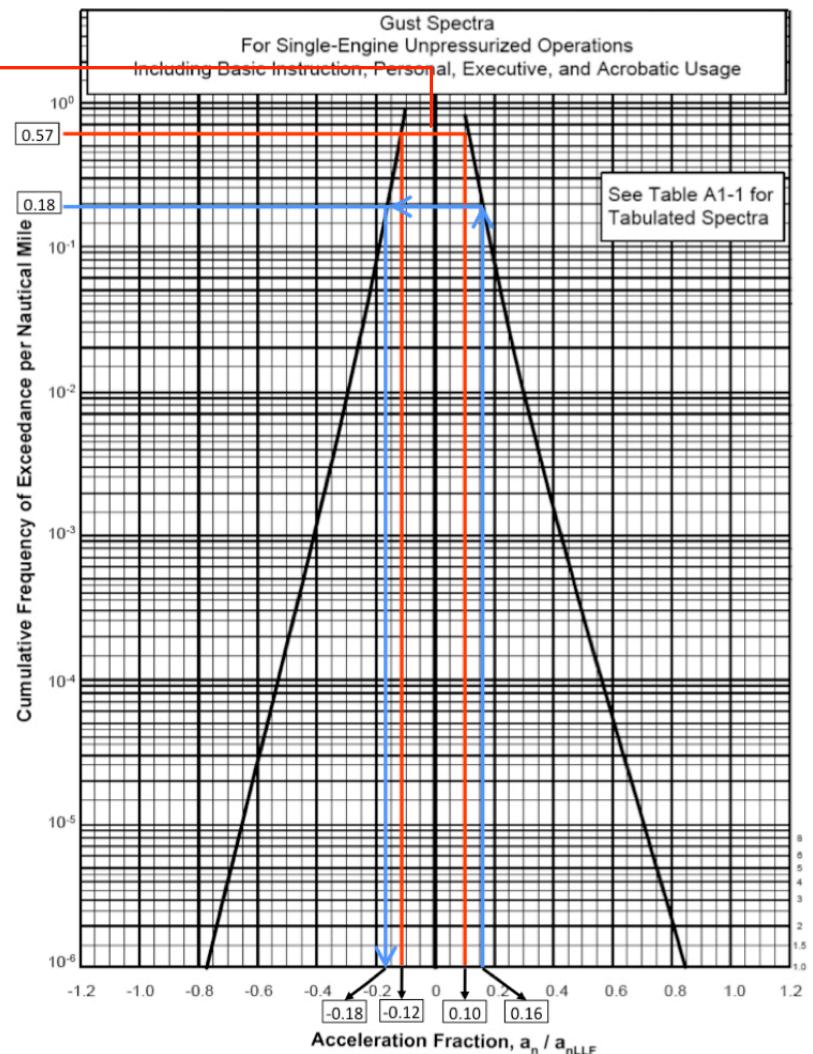

$$(a_{nLLF}) \times (a_n/a_{nLLF})$$

$$\begin{aligned} a_n &= -0.259 \\ a_n &= 0.28 \end{aligned}$$

Stress = 7410 PSI @ Critical Component (1 g)

Maximum and minimum delta stress over and below the maximum stress @ the critical component

$$\begin{aligned} (+) \Delta \text{Max. Stress} &= 2070 \text{ psi} \\ (-) \Delta \text{Max Stress} &= -1920 \text{ psi} \end{aligned}$$

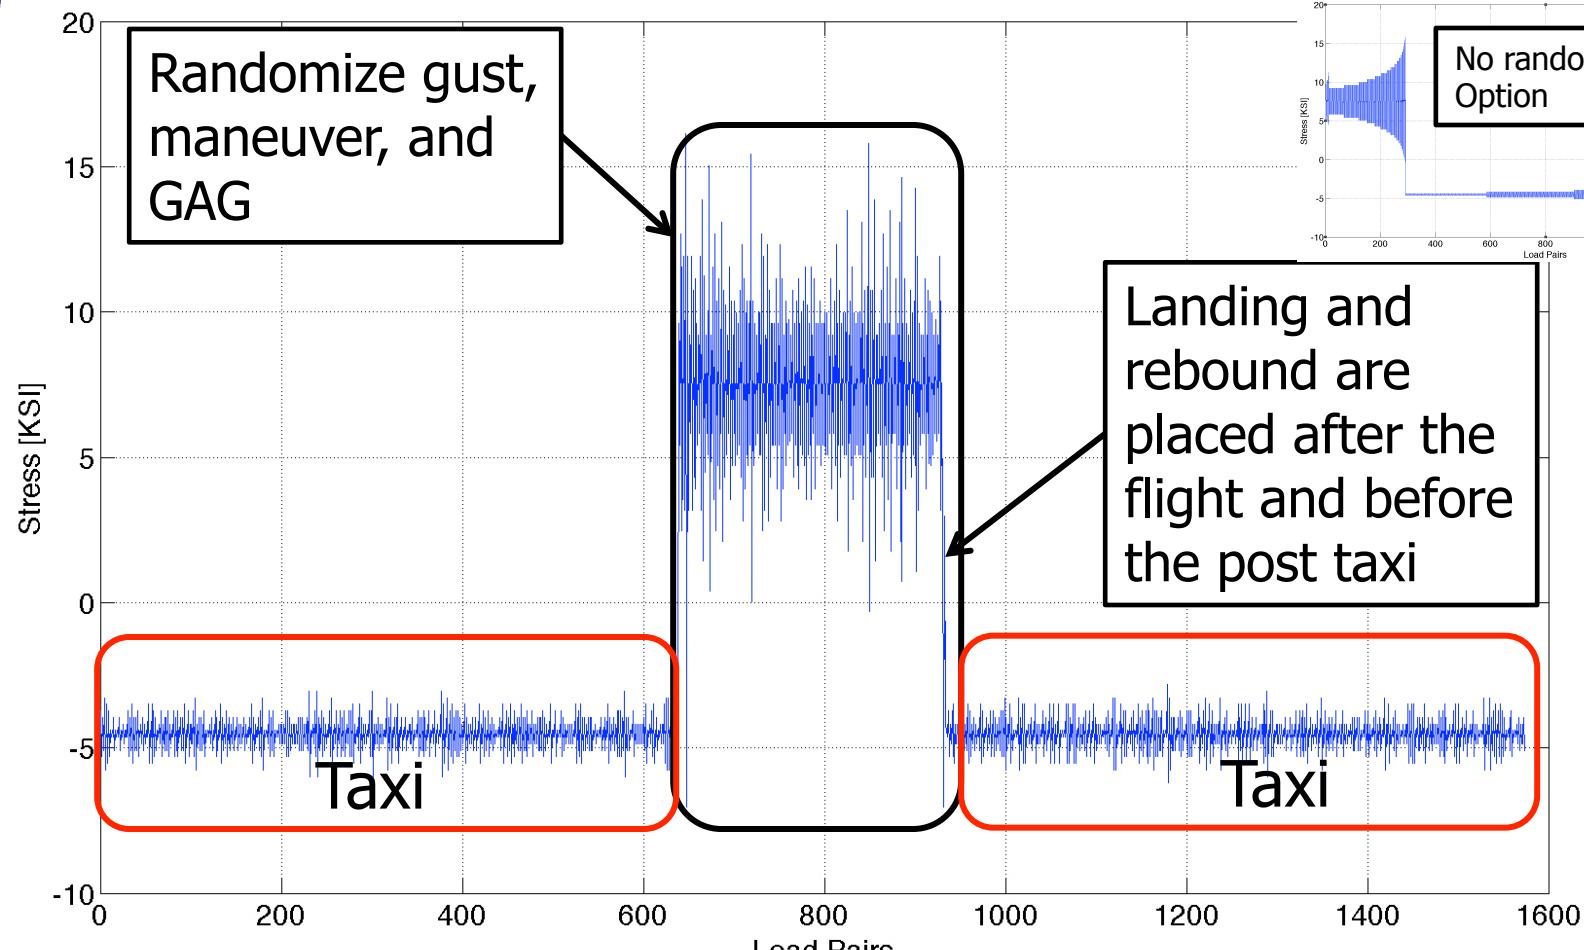

NuSS
Sustainment
Solutions

TEXTRON AVIATION

Loading Example

Randomize taxi loads and split half before the flight and half after the flight,
Taxi load can be excluded from the analysis.

Building Spectra

SMART - Small Aircraft Risk Technology

Select usages

Define spectrum standard deviation

Design limit load factors

Define 1g stress, V_C , & matrix size

Defining Flight Matrices

Define 1g stress, V_C , & matrix size

The screenshot shows the SMART - Small Aircraft Risk Technology software interface. The 'Usage Spectra' tab is selected. A red box highlights the 'One G Stress (psi)' field (5500), the 'Average Velocity (Vno/Vmo(Knots))' field (200), and the 'Number of Velocities' field (7). Another red box highlights the 'Ground Stress (psi)' field (-500) and the 'Number of Flight Times' field (1).

Defining Flight Matrices

Matrix

Flight Times vs. Velocity		%Vno or %Vma						
Flt. Time(hrs)	% of Flts.	0.510	0.600	0.605	0.735	0.740	0.745	0.900
2.133	1.0	0.023	0.053	0.046	0.251	0.251	0.251	0.125

Flight Times vs. Weight		%Max. Wt.						
Flt. Time(hrs)	% of Flts.	0.944	0.949	0.959	0.973	0.986	0.995	0.998
2.133	1.0	0.023	0.125	0.251	0.251	0.251	0.053	0.046

Define velocity matrix

Define weight matrix

Scaling 1g Stresses

- ❑ Weight matrix uses weight as a proxy to scale 1g stresses
- ❑ If 1g stresses are known can use weight matrix to scale stresses directly

Segment	1g Stress	KEAS	% Duration
CLIMB	5186	121	0.046
CLIMB	5223	120	0.053
CRUISE	5317	147	0.251
CRUISE	5413	148	0.251
CRUISE	5429	149	0.251
DESCENT	5434	180	0.125
APPROACH	5520	102	0.023

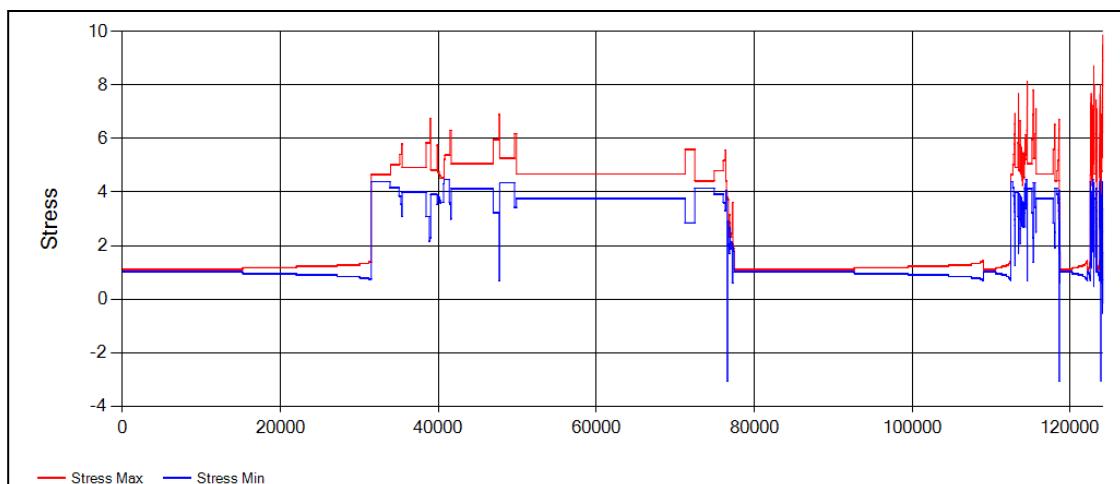

Max 1g Stress = 5600 psi

Average Weight During Flight, % Max Takeoff Weight							
Flight Time (hrs)	% of Flights	0.926	0.933	0.949	0.967	0.969	0.970
2.133	1.0	0.023	0.125	0.251	0.251	0.251	0.046

Loading Generation (User Defined)

Smart allows the user to load Afgrow spectra files (.sp3 and .sub). The GUI will read the “.sp3”
